PROFESSIONAL SUMMARY

Third-year Computer Science student and full-stack developer who builds web applications, automation, and AI tools end to end, from the database and REST APIs to the interface. I care about software that works reliably, so my projects include automated tests that run in CI. I automate repetitive processes wherever I can and use AI as a development tool to write, debug, and learn faster.

TECHNICAL SKILLS

Languages:
Python, JavaScript, TypeScript, Bash, SQL

Backend & APIs:
FastAPI, Node.js, REST APIs, Swagger / OpenAPI

DevOps & CI/CD:
GitHub Actions, Docker, Docker Compose, Nginx, AWS, Linux, Git

Automation & AI:
Web scraping, LLM APIs, n8n, Claude Code, Cursor, Codex

Frontend:
React, HTML, CSS

Databases:
PostgreSQL, SQLAlchemy, Alembic

Testing & Monitoring:
pytest, HTTPX, Playwright, Testcontainers, Node.js test runner, API & integration testing, Lighthouse, Prometheus, Grafana

PROJECTS

iPhone Price Tracker — Georgian Market — GitHub

Python, FastAPI, async SQLAlchemy, PostgreSQL, Alembic, pytest, HTTPX, Testcontainers, Playwright, Docker Compose, Nginx

- Built a price-comparison platform with retailer-specific scrapers that pull listings from multiple Georgian stores (Zoommer, Alta and more) into one searchable catalog, replacing manual store-by-store checks.
- Recorded every price change to build a price history for each model, and logged the outcome of every crawl.
- Implemented user accounts, product tracking, and target-price alerts delivered through Telegram; documented the REST API with Swagger UI.
- Covered auth, alerts, notifications, and every scraper parser with async pytest + HTTPX tests, including edge cases like listings with missing prices.

Video Downloader — GitHub

Node.js, Express, TypeScript, React, PostgreSQL, yt-dlp, FFmpeg, Prometheus, Docker Compose, GitHub Actions

- Built an asynchronous downloader for YouTube and other sites in 360p, 720p, 1080p, or audio-only MP3; yt-dlp runs as background processes, two at a time, and FFmpeg merges video and audio.
- PostgreSQL stores every download job, and a React and TypeScript interface shows live progress and saves finished files.
- Set up GitHub Actions CI that builds the app and runs integration tests against PostgreSQL on every push, including checks that invalid input is rejected; exposed Prometheus metrics at /metrics.

ModzebnAI — AI Job Radar — In progress

React, TypeScript, FastAPI, Python, PostgreSQL, LLM API, Web Automation, Docker

- Building an AI-powered job radar for the Georgian market: scheduled scrapers collect new postings from jobs.ge, hr.ge and other boards into one PostgreSQL database.
- AI compares each posting with the user's CV, scores the fit, and explains why; strong matches trigger an email with a tailored, AI-drafted cover letter.
- React and TypeScript dashboard for browsing matches, fit scores, and generated cover letters.

EXPERIENCE

Junior Software Engineer at Rento Group — Aug 2026 – Present

rento.ge

- Set up external uptime, content and SSL-expiry monitoring for the company website, with alerts sent as soon as a check fails.
- Wrote Playwright end-to-end tests for the company website (page availability, broken images, contact links, mobile layout), scheduled to run daily in CI to catch regressions before customers do.
- Improved the company website's Lighthouse scores (Performance 75 → 95, Accessibility 74 → 91) by optimizing images, eliminating layout shift and fixing accessibility issues.

EDUCATION

BSc in Computer Science · ALTE University, Tbilisi — Sep 2024 – Expected 2028

Relevant coursework: Data Structures & Algorithms, Databases, Operating Systems, Computer Networks.

LANGUAGES

Georgian: Native

English: Professional Working Proficiency (C1)
